

ORACLE TIP

Oracle dynamic sampling hint

- `dynamic_sampling` hint is very useful for highly volatile tables and global temporary tables.
- In 10g, you can use the `dynamic_sampling` hint to direct Oracle to estimate the cardinality of highly volatile tables on the fly.
- The dynamic sampling hint is also useful for estimating the size of dynamically created objects such as global temporary tables (GTT's)
- `select /*+ dynamic_sampling(temp_cpgrp 4) */ cpgrp_num, cpgrp_desc,`
